

Emulator with Switching Network Connections

Terry Lee Goode

ABSTRACT OF THE DISCLOSURE

5      Serializing and deserializing circuits are provided on  
an emulator circuit board to group input and output signals  
of programmable logic devices for routing through a cross  
point switch. In one instance, the input and output signals  
of the programmable logic devices are time-multiplexed  
signals of virtual interconnections. The cross point switch  
10     can be configured for static or dynamically scheduled  
operations.
